## Activity B: Creation of Lists with Objects

### Scenario

A client of your company is passing you an object that represents the size of the rooms of a house. Build a list--titled "**My dream house**" and exploit the object to enumerate the rooms and their size.

Refer to the code placed at <https://jsfiddle.net/packt/797vam1p/>. The data property in the Vue instance is like this code:

```
data: {  
  house: {  
    entrance: 4,  
    'living room': 15,  
    bathroom: 7,  
    bedroom: 12  
  }  
}
```

### Aim

To enumerate object properties to render lists.

### Steps for Completion

1. First, you should build a `<div>` that will contain our application as shown in this code:

```
<div id="app">  
</div>
```

2. Inside the `<div>` we just created, you can insert a title:

```
<h3>  
  My dream house  
</h3>
```
